We have plants hanging down from a ledge or balcony, we also have plants reaching up and climbing growing up against walls. The plants live on and hang down from and reach up towards from, a structure of walls, low balcony like walls, there are also white or pale gray arch shapes in the horizontal plane seen to the left and to the right from the top wall drawn. Important here is that we are up at an elevation, I was not able to see the floor by reaching downward so the floor is further down below.

Target PDF, decoy PDF, and matching, done without delay.

Note: I was about to save the decoy PDF with the random file name, for some reason the sequence of pressing buttons did not follow through, so I closed the windows there. I then generated another decoy, and this time internet was slow so it would not load, so I stopped the page and generated another (in fact third) decoy image. So there was an actual decoy, never seen nor saved, which did not save, and possibly a second decoy if one was generated when internet was slow or perhaps none generated then, and then the final one that I did manage to produce to completion, which was then the second or third actual decoy generated here.

Before I see the two images. Found were a strong presence of plants, and pale gray walls and balconies whether natural or as part of housing. Not detected human, animal, floor, ceiling, manmade objects unless the walls are part of manmade building. The ceiling was also not there but continued as if up to the sky, this suggests we would be outdoors.

Matching: Neither image is a great match to my report. I suspect possibly a merge here. I did not detect water. I choose the image with the water, airplane and boat, even though it is not a good match so it feels like I am only guessing. It does have trees in the background and balconies on the boat.

Outcome: I chose the wrong image. Actually I did recognize the white wall with the sort of white protruding balcony above it, on the target image which is in a city. But the match is not good to either of the images, the target image does not have the plantlife. Switching is not plausible here, merging is possible here, and fail session less likely. I would suspect either merge or fail session.
