Internet Search Images B6 Target 1
Today April 14, 2019
Start 11:23 AM

Six search words from random word generator, I know the words before start of session.

Note: The word generator had only generated six words, one of the spaces in the middle was blank. I generate another six words.

Stairs Fingers Lion Belt Apple Buffalo

Something large, bulging, blue, fairly round, like a big meatball shaped, it has got ripples all across its front so it is not a smooth solid surface there. It looks like a big pinyata, darker blue on the sides and light blue on the front belly and all made out of thick light weight paper hairs.

11:28 AM Secondary stage

It feels puffy and inflated and bloated inside like it has expanded and feels stretched out on the belly. Under it on the floor there is a flat red circle.

I put a hand against the blue element, a gust of wind appears and blows from down to up and all the paper hairs rise up. It's like a mop with those long thick soft fibers. I touch the right side on the drawing of the blue element and there is movement there that I cannot quite describe. It is not a living being this is not a living animal the blue element. The red circle again this time it rises up to try to get to above the blue element.

Probe red circle: Strange sensations about how it can be handled and felt.

I will probe the back side of the blue and then that is enough of probing to keep these sessions similar: Lifeless, dead, this is not a living being.

11:34 AM End RV.

The fibers that I drew are similar to fingers. During the session, logic or me kept thinking that I could have a buffalo pinyata or toy. I do not like the distraction of having the search words. The target image is not blue and there is no recognizable red flat circle anywhere. There is a living being and I sensed that the fingers are not part of a living being. The correlation is very poor. Was the impression of the many paper or soft fabric fibers generated by logic that knew one of the search words to be "fingers", or was I sensing the fingers on the target image by RV?

I cannot grade these sessions with consideration to the protocol, I grade purely based on the correlation so the speculation as to where information comes from (logic or RV) is irrelevant for grading purposes. It pains me to give this session a C because of the fingers, when normally I might have given this an F. Grade is C but it really does not deserve it.

11:40 AM End session.
