Target WR3

Today April 17, 2019

Start 11:54 PM

Fresh air, we are out in the open out at sea. The sky is wide open and the ocean down below. The water however feels hard like a block and that is not normal of water! It feels easy-going here.

Spend some time feeling the target signal: We have got a hard big block in the water! It is not really meant to be there!

Complete the initial stage to find all initial elements: The hard block under the water. We have to pry it open. It has not sunk in there.

11:57 PM Secondary stage

Probe block: It was tried to pull it out of there, there are whispers going on there. Probe properly, run hands along it: We are under the water, air bubbles rise up from my nostrils when I am visiting it. Probe its sides with the hands: My hand gets grabbed and pulled into it by something or someone. It grabs my hand harshly and aggressively when I try to run my hand along the side in two different places. Probe top: I can look down inside of it.

Locate the block element from the target signal, not from memory: I am out on the open ocean. Probe the water surface: There is a white floating balloon delicate like a paper bag or balloon floating up above me.

I find the sunken down black element under water again from the target signal. I go to it. It wants to grab me, it is violent! There are several green pebbles like green peas on it. The peas are stuck to the black element and cannot be picked up or rolled around.

I am sorry but I am very scared of the black element, it is horrible to have to probe it, horrible to have to be there. It is something hideous like a monster shark with horrible teeth and bloody eyes. I will poke it with a stick but not my finger. Oddly it feels like tissue when I poke it with a stick.

Probe the underside of the black element with a stick, if it is dark turn the lights on: It has sunken down it is very very heavy. I am very scared and uncomfortable to be near it. It is super dark down here. I pretend I am using binoculars to look down to it from the surface. It is just this deep dark abyss down there dark. I stay at the surface and push down a long stick gradually to poke it but I stay up here where it is safe and light colored. There is a living body down there, or body at least,

animal or human I am not sure. Ribs.

I go down there and I push the black element aside to reveal more info. It is something horrendous like a great big shark with teeth and red blood eyes. I am scared of it.

I will use shook method because I cannot pat it down. Shook method rises us up to the water's surface. I use fiber displacement method, it brings me up to the surface.

Conclusion: The target is a picture of out at the open sea. There might be a large black heavy or even scary element under the water, it was not possible to probe it well because it grabs me and feels scary and is very dark.

12:14 midnight End RV.

The target is a blue surroundings with one or two black boxes. The session gets a C for correlation of basic shapes and colors, but the understanding of what the colors and shapes should be was incorrect. Grade C.

12:18 midnight End session.

#### ELEMENTS

IE. The wide open sky over the water.

IE. The water below.

IE. The water being a hard big block.

P. Can look down into it from the top.

SE. Floating white delicate paper balloon above me.

SE. Several green pebbles like green peas on the black element.

P. Are stuck to the black element and cannot be moved.
